Mean Squared Prediction Error Estimation in Mixed Models

Time: 3:00 – 4:00 PM

Date: Friday, October 12, 2007

Place: Tuttleman Learning Center 401B

Abstract

Mixed models are widely used for analyzing clustered data. For example, they are often applied to epidemiology, medicine, econometrics and sample surveys. Prediction is usually the main goal of such analyses, and mean squared prediction error is the main way in which prediction performance is measured. In this talk we will discuss some issues and new techniques of mean squared prediction error estimation.
